

Analytics and Reporting in FlowDesk

Use FlowDesk Analytics to monitor support performance, identify operational trends, and make informed decisions about team workload and customer service.

Introduction to FlowDesk Analytics

FlowDesk Analytics gives support managers and administrators a consolidated view of support performance. By monitoring ticket activity, response and resolution performance, workload, and customer satisfaction, teams can identify bottlenecks and adjust processes to improve service quality.

Analytics should be used as an operational tool rather than as a single scorecard. Comparing related metrics over time can help teams determine whether changes in staffing, routing, priorities, or workflows are improving support outcomes.

Core Metrics

FlowDesk provides the following core support metrics. These metrics form the basis of standard reporting and are also useful for understanding broader team performance.

Metric	Description	Availability
Ticket volume	The volume of support tickets represented in the selected reporting view.	Standard reporting; Advanced Analytics on Pro and Enterprise.
Resolution time	The time associated with resolving support tickets in the selected reporting view.	Standard reporting; Advanced Analytics on Pro and Enterprise.
First response time	The time associated with providing the first response to a support ticket.	Standard reporting; Advanced Analytics on Pro and Enterprise.
Agent workload	A view of support work handled by agents, useful for identifying workload distribution.	Standard reporting; Advanced Analytics on Pro and Enterprise.
Customer satisfaction	A support performance indicator based on customer satisfaction data available in FlowDesk.	Standard reporting; Advanced Analytics on Pro and Enterprise.

Understanding the Core Metrics

- **Ticket volume:** Monitor incoming support demand and compare activity across reporting periods.
- **Resolution time:** Use changes in resolution time to identify delays in the support process.
- **First response time:** Track how quickly customers receive an initial response and use the result to evaluate response practices.
- **Agent workload:** Compare workload across agents to identify uneven distribution or potential capacity issues.
- **Customer satisfaction:** Review customer satisfaction alongside operational metrics to understand how support performance is experienced by customers.

Note: FlowDesk Analytics reports the metrics defined by the product. Do not interpret one metric in isolation; for example, a reduction in resolution time should be evaluated together with first response time, workload, and customer satisfaction.

Access and View Analytics Reports

Follow these steps to access and review analytics in the FlowDesk dashboard.

- 1. Open Analytics** — Sign in to FlowDesk and open Analytics from the workspace dashboard.
- 2. Select the reporting view** — Choose the available analytics or reporting view for the performance information you want to examine.
- 3. Review the metric summary** — Review ticket volume, resolution time, first response time, agent workload, and customer satisfaction as applicable to the selected view.
- 4. Set the reporting period** — Select the reporting period provided by the dashboard to focus the analysis on the time range you need.
- 5. Apply filters** — Use the available dashboard filters to narrow the report to the relevant support data.
- 6. Compare results** — Compare related metrics and reporting periods to identify trends, workload changes, or response-time issues.
- 7. Interpret and act** — Use the findings to adjust support processes, staffing, routing, or automation workflows where appropriate.

Filtering Analytics

Filtering allows managers to focus a report on the portion of support activity relevant to the question being investigated. For example, when reviewing agent workload, select the reporting scope that corresponds to the team or operational view being evaluated.

When filtering reports:

- Confirm the selected reporting period before interpreting a metric.
- Use consistent filter selections when comparing two reporting views.
- Record the filter context when sharing findings with other administrators or team leads.
- If a filtered view appears empty, remove restrictive filters one at a time to identify the condition that excludes the data.

Standard Reporting vs. Advanced Analytics

FlowDesk distinguishes standard reporting from Advanced Analytics. The core analytics metrics are part of FlowDesk's reporting capabilities, while Advanced Analytics is an expanded analytics capability available only on Pro and Enterprise plans.

Capability	Free	Pro	Enterprise
Core metrics	Available	Available	Available
Advanced Analytics	Not available	Available	Available

Plan Availability

Advanced Analytics is available on Pro and Enterprise plans only. Free customers do not have access to Advanced Analytics.

The plan distinction applies specifically to Advanced Analytics. The FlowDesk Master Product Specification does not define additional analytics metrics or separate reporting limits beyond this distinction.

Using Metrics to Improve Support Performance

Analytics is most useful when teams connect measured performance to operational changes. Use the following practices to turn reporting data into actionable improvements.

Improve response times

- Monitor first response time regularly rather than relying only on ticket volume.
- Compare first response time with agent workload to identify whether response delays correspond with uneven workload.
- Review ticket routing and automation when recurring categories of tickets experience slower responses.
- Use reporting periods consistently so improvements can be measured after a process change.

Improve agent efficiency

- Review agent workload to identify significant differences in assigned support work.
- Compare workload with resolution time to identify teams or workflows that may require process review.
- Use ticket volume trends to anticipate periods of higher support demand.
- Consider customer satisfaction alongside operational metrics before changing a workflow.

Warning

Avoid using a single metric as the sole measure of team performance. A lower resolution time, for example, should not automatically be treated as an improvement if customer satisfaction or first response performance is declining.

How Analytics Data Is Aggregated and Retained

FlowDesk aggregates support activity into reporting metrics so managers can review performance over the selected reporting period. The dashboard presents the core metrics in the context of the reporting view and filters selected by the administrator.

Customer support data is retained for 12 months after account termination. Enterprise customers may request custom retention periods subject to their contract. Accordingly, reporting availability is subject to the underlying data retained by the FlowDesk account.

Note: The Master Product Specification does not define a separate analytics-specific retention period or a detailed calculation formula for each metric. Do not infer additional retention guarantees or metric calculations beyond the documented FlowDesk capabilities.

Troubleshooting Reporting Issues

A metric is missing from the dashboard

Confirm the selected plan and reporting view. Advanced Analytics is available only on Pro and Enterprise. If the metric is a core metric, review the active filters and reporting period.

The report shows no data

Check the reporting period and remove restrictive filters. Confirm that the selected reporting scope contains support activity for the period being viewed.

Two reports show different values

Compare the reporting period and filter selections used by both reports. Different reporting scopes can produce different metric results.

Recent activity is not visible

Confirm that the activity falls within the selected reporting period and that no filters exclude it. If the account has been terminated, remember that support data is retained for 12 months after termination unless an Enterprise contract specifies a custom retention period.

Agent workload appears unexpected

Review the selected reporting scope and period, then compare workload with ticket volume. Check whether the view is filtered to the intended group of support activity.

Customer satisfaction appears inconsistent with other metrics

Review customer satisfaction together with ticket volume, first response time, resolution time, and agent workload. These metrics measure different aspects of support performance and do not necessarily move together.

Analytics Review Checklist

- Confirm the reporting period before reviewing results.
- Check active filters and reporting scope.
- Review ticket volume, resolution time, first response time, agent workload, and customer satisfaction together.
- Use Advanced Analytics only when the workspace is on Pro or Enterprise.
- Compare trends over consistent reporting periods.
- Investigate unexpected results by checking filters and data scope before changing support processes.
- Use analytics findings to guide workflow, routing, staffing, and response-time improvements.

Related FlowDesk Capabilities

Analytics can be used alongside Ticket Management, Customer Management, Automation, Team Management, and other FlowDesk capabilities to understand support operations and improve customer service processes.
