

Ticket Management in FlowDesk

Introduction to FlowDesk Ticket Management

FlowDesk tickets provide a structured way for support teams to manage customer requests from initial intake through resolution and closure.

A ticket contains customer information, request details, priority, status, and assignment information. Support agents can create, update, assign, prioritize, and track tickets directly from the FlowDesk dashboard.

A typical ticket management process is:

1. Create or receive a ticket.
2. Associate the ticket with a customer.
3. Set an appropriate priority.
4. Assign the ticket to a support agent.
5. Investigate and respond to the request.
6. Update the ticket status as work progresses.
7. Resolve the request.
8. Close the ticket when no further support work is required.

[IMAGE: FlowDesk Tickets dashboard showing a list of tickets with status, priority, assigned agent, customer, and updated time]

Note: Consistent use of statuses, priorities, and assignments helps support teams identify work that requires attention and maintain an organized ticket queue.

Ticket Anatomy & Data Structure

Every FlowDesk ticket contains a defined set of fields that describe the customer request and its current state.

Field	Description	Example
ticket_id	Unique identifier for the ticket	TCK-10482
customer_id	Identifier of the customer associated with the ticket	CUS-2041

Field	Description	Example
<code>subject</code>	Short summary of the customer's request	Unable to access dashboard
<code>description</code>	Detailed information about the support request	Customer cannot access the dashboard after signing in
<code>status</code>	Current state of the ticket	open
<code>priority</code>	Urgency assigned to the ticket	high
<code>assigned_agent</code>	Agent responsible for handling the ticket	agent@example.com
<code>created_at</code>	Date and time when the ticket was created	2026-09-08 09:15
<code>updated_at</code>	Date and time when the ticket was last updated	2026-09-08 10:30

ticket_id

`ticket_id` uniquely identifies a ticket within FlowDesk.

Use the ticket ID when referring to a specific ticket, especially when communicating with other members of the support team.

customer_id

`customer_id` identifies the customer associated with the ticket.

A ticket should be associated with the correct customer so agents can understand who submitted the request and access the relevant customer profile.

subject

The subject provides a concise summary of the customer's issue.

A good subject should allow an agent to understand the general purpose of a ticket without opening its full description.

description

The description contains the detailed information required to understand and investigate the request.

Include relevant information such as:

- What the customer is trying to accomplish
- What happened
- Relevant error information
- Steps that led to the issue
- Other details provided by the customer

status

The status represents the ticket's current position in the support workflow.

FlowDesk supports four ticket statuses:

- open
- pending
- resolved
- closed

priority

Priority indicates how urgently a ticket should be handled.

FlowDesk supports four priorities:

- low
- medium
- high
- urgent

assigned_agent

`assigned_agent` identifies the support agent responsible for handling the ticket.

Assigning tickets helps prevent requests from being overlooked and makes agent workload easier to manage.

created_at and updated_at

`created_at` records when the ticket was created.

`updated_at` records when the ticket was most recently updated.

Agents can use these timestamps to understand how long a ticket has been in the system and identify tickets that may require attention.

Supported Ticket Statuses

FlowDesk supports four ticket statuses.

Status	When to use it	Typical meaning
open	The ticket requires active support work	Work needs to be performed
pending	Work is temporarily waiting	Additional information or action is required before proceeding
resolved	The customer's request has been addressed	The support issue has been resolved
closed	The support process is complete	No further support work is expected

[IMAGE: FlowDesk ticket details panel showing the four available ticket statuses]

Open

Use `open` when a ticket requires active attention from the support team.

For example, a newly created customer support request can remain `open` while an agent investigates the issue.

Pending

Use `pending` when progress is temporarily waiting for additional information or another action.

For example, an agent may place a ticket in `pending` while waiting for information needed to continue investigating the customer's request.

Tip: Use `pending` to distinguish tickets that are waiting from tickets that are actively being worked on.

Resolved

Use `resolved` when the customer's support request has been addressed.

An agent should verify that the requested support has been provided before marking a ticket as resolved.

Closed

Use `closed` when the ticket is considered complete and no further support work is expected.

Closing a ticket indicates that the support process for that request has finished.

Ticket Priorities

Ticket priority helps agents triage incoming support requests and determine which work should receive attention first.

Priority	Recommended use	Triage consideration
<code>low</code>	Minor or non-urgent requests	Can generally be handled after higher-priority work
<code>medium</code>	Routine support requests	Normal support queue
<code>high</code>	Requests requiring increased attention	Should receive attention ahead of routine work
<code>urgent</code>	Requests requiring immediate attention	Should be prioritized immediately

[IMAGE: FlowDesk ticket list with tickets grouped or displayed by low, medium, high, and urgent priority]

Low

Use `low` for requests that do not require immediate attention.

Medium

Use `medium` for standard support requests that require normal handling.

High

Use `high` when a request requires more attention than a routine ticket.

Urgent

Use `urgent` for requests requiring immediate attention.

Warning: Priority should reflect the urgency of the support request rather than simply the order in which tickets were received.

Creating a Ticket Manually

Agents can create tickets directly from the Tickets dashboard.

Create a ticket

1. Open **Tickets**.
2. Select **Create Ticket**.
3. Select the customer associated with the request.
4. Enter a concise subject.
5. Enter the details of the customer's request in the description.
6. Select a priority.
7. Assign the ticket to an appropriate agent, if applicable.
8. Save the ticket.

[IMAGE: Create Ticket form showing customer, subject, description, priority, and assigned agent fields]

After the ticket is created, FlowDesk records its `ticket_id`, `created_at`, and `updated_at` values.

New tickets use the `open` status as the starting point of the standard ticket workflow.

Updating a Ticket Manually

Agents should keep ticket information current as work progresses.

Update ticket details

1. Open **Tickets**.
2. Select the ticket you want to update.
3. Review the existing ticket information.
4. Update the relevant fields.
5. Save the changes.
6. Confirm that the updated information is displayed correctly.

[IMAGE: Ticket details page with editable subject, description, priority, status, and assigned agent fields]

Common reasons to update a ticket include:

- Changing the priority after understanding the impact of an issue
- Updating the description with relevant information
- Assigning the ticket to another agent
- Moving the ticket to a different status

The `updated_at` value reflects the latest ticket update.

Assigning a Ticket Manually

Assign each ticket to the agent responsible for handling it.

Assign or reassign a ticket

1. Open the ticket.
2. Locate the **Assigned Agent** field.
3. Select the appropriate support agent.
4. Save the ticket.
5. Verify that the correct agent is displayed.

[IMAGE: Ticket details page highlighting the Assigned Agent selector]

Reassignment may be appropriate when:

- The current agent is not responsible for the request.
- The ticket requires a different support responsibility.
- Workload needs to be redistributed.

FlowDesk automation can also assign tickets using the `assign_ticket` action.

Managing Ticket Workflows and Status Transitions

Ticket status should reflect the actual state of the support request.

A common workflow is:

```
graph TD
    open --> pending
    pending --> open
    open --> resolved
    resolved --> closed
```

The workflow can vary depending on the circumstances of the request. For example, a ticket may move directly from `open` to `resolved` when an agent can address the request without waiting for additional information.

Moving a ticket to pending

Move a ticket to `pending` when progress is temporarily waiting for additional information or action.

When the required information becomes available, update the ticket back to `open` so it can return to active work.

Moving a ticket to resolved

Move a ticket to `resolved` after the support request has been addressed.

Before resolving a ticket, verify that:

- The requested support has been provided.
- Relevant ticket information is up to date.
- The ticket has the correct customer and assignment information.

Moving a ticket to closed

Move a ticket to `closed` when the support process is complete and no further support work is expected.

Note: FlowDesk defines four supported ticket statuses. Do not use custom status values such as `in_progress`, `cancelled`, or `escalated` as ticket statuses.

Filtering, Sorting, and Searching Tickets

The Tickets dashboard provides tools for locating and organizing tickets efficiently.

[IMAGE: FlowDesk Tickets dashboard showing search, filtering, and sorting controls]

Searching for tickets

Use the ticket search functionality to locate a specific ticket or narrow the ticket list.

When looking for a known request, useful information includes:

- Ticket ID
- Customer information
- Subject

- Other searchable ticket information available in the dashboard

Filtering tickets

Use filters to focus on tickets that meet specific criteria.

Common ticket-management filters include:

- Status
- Priority
- Assigned agent
- Customer

For example, an agent can filter the ticket queue to display only:

```
Status: open
Priority: urgent
Assigned agent: Current Agent
```

This helps the agent focus on urgent requests that require active attention.

Sorting tickets

Sort the ticket list to organize work according to the information most relevant to the current task.

Useful sorting considerations include:

- Creation time
- Last updated time
- Priority
- Status
- Assigned agent

Tip: When reviewing an active queue, combining filters with priority-based sorting can help surface high-priority tickets that require attention.

Best Practices for Maintaining Resolution SLAs

Enterprise customers have access to **SLA** capabilities. Support teams should use consistent ticket-management practices to help meet their contractual support commitments.

Monitor urgent and high-priority tickets

Review **urgent** and **high** priority tickets frequently.

Prioritize tickets based on both urgency and the applicable support commitments.

Keep assignments current

Every actively managed ticket should have the appropriate assigned agent.

Avoid leaving tickets assigned to an agent who is no longer responsible for the request.

Keep ticket information updated

Update ticket information as the situation changes.

In particular:

- Keep the priority accurate.
- Keep the status accurate.
- Keep the assigned agent accurate.
- Record relevant changes in the ticket information.

Avoid leaving active tickets unattended

Regularly review tickets that remain `open`.

Tickets that have remained open for an extended period should be reviewed to determine whether they require additional action, reassignment, or a status update.

Review pending tickets

Pending tickets can remain unresolved while waiting for information or another action.

Review pending tickets regularly so that requests do not remain inactive after the required information becomes available.

Note: Enterprise SLA availability is part of the Enterprise plan. The FlowDesk Master Product Specification does not define specific SLA response or resolution time targets; applicable Enterprise SLA commitments should therefore be determined by the customer's contract.

Tickets, Automation, and Webhooks

Tickets can participate in automated workflows.

Automation triggers

FlowDesk automation supports ticket-related triggers including:

- `ticket.created`
- `ticket.updated`
- `ticket.priority_changed`

These triggers can start configured automation actions.

Supported actions include:

- `assign_ticket`
- `change_priority`
- `add_tag`
- `send_email`
- `send_webhook`

For example:

```
Trigger:
ticket.created

Action:
assign_ticket
```

This configuration can automatically assign a newly created ticket to an appropriate agent.

[IMAGE: FlowDesk automation configuration showing ticket.created connected to an assign_ticket action]

Ticket webhooks

FlowDesk supports the following webhook events:

- `ticket.created`
- `ticket.updated`
- `ticket.resolved`
- `customer.created`

Webhook requests are sent using **HTTPS POST**.

Failed webhook deliveries are retried up to **3 times**.

Note: Webhooks are available on Pro and Enterprise plans. They are not available on the Free plan.

Automation and webhook considerations

When configuring ticket automations:

1. Verify that the selected trigger matches the intended event.
2. Confirm that the action is configured correctly.
3. Check that the workspace plan supports any required feature.
4. Verify the resulting ticket information after the automation executes.

Troubleshooting Common Ticket Management Issues

A ticket has the wrong priority

Open the ticket and review its priority.

1. Assess the urgency of the customer request.
2. Select the appropriate priority.
3. Save the ticket.
4. Confirm that the new priority is displayed.

Use `urgent` only when the request requires immediate attention.

A ticket is assigned to the wrong agent

1. Open the ticket.
2. Review the **Assigned Agent** field.
3. Select the correct agent.
4. Save the ticket.
5. Confirm the new assignment.

A ticket is in the wrong status

Review the current state of the support request and select the appropriate supported status:

- `open`
- `pending`
- `resolved`
- `closed`

Do not create a new status to represent a situation that can be represented by one of the supported statuses.

A ticket is not appearing in a filtered list

If a ticket cannot be found in a filtered view:

1. Clear the current filters.
2. Search for the ticket using its `ticket_id`, subject, or customer information.

3. Confirm the ticket's current status.
4. Confirm its priority and assigned agent.
5. Reapply filters after locating the ticket.

A ticket may be excluded from a filtered view because its current field values do not match the selected criteria.

An automation did not update a ticket

Check the automation configuration and verify:

1. The correct trigger is configured.
2. The expected event occurred.
3. The intended action is configured.
4. The workspace has access to any required feature.
5. The ticket contains the information required by the action.

A webhook did not arrive at the destination

Verify that:

1. Webhook functionality is available on the workspace plan.
2. The webhook is configured for the correct event.
3. The destination endpoint accepts HTTPS POST requests.
4. The receiving system is available to accept the request.

FlowDesk retries failed webhook deliveries up to 3 times.

Recommended Ticket Management Workflow

For consistent ticket handling, support teams can use the following process:

1. **Review the request** — Understand the customer's issue before taking action.
2. **Confirm the customer** — Verify that the correct customer is associated with the ticket.
3. **Set the priority** — Select `low`, `medium`, `high`, or `urgent` based on urgency.
4. **Assign ownership** — Assign the ticket to the appropriate support agent.
5. **Work the ticket** — Investigate and address the customer's request.
6. **Update the status** — Use `open`, `pending`, `resolved`, or `closed` to represent the current state.
7. **Review pending work** — Follow up on tickets waiting for information or action.
8. **Resolve the request** — Mark the ticket `resolved` when the support request has been addressed.
9. **Close completed work** — Mark the ticket `closed` when no further support work is expected.

Best practice: Keep ticket fields accurate throughout the entire lifecycle. Accurate statuses, priorities, assignments, and timestamps make the ticket queue easier to manage and improve the quality of FlowDesk analytics.
